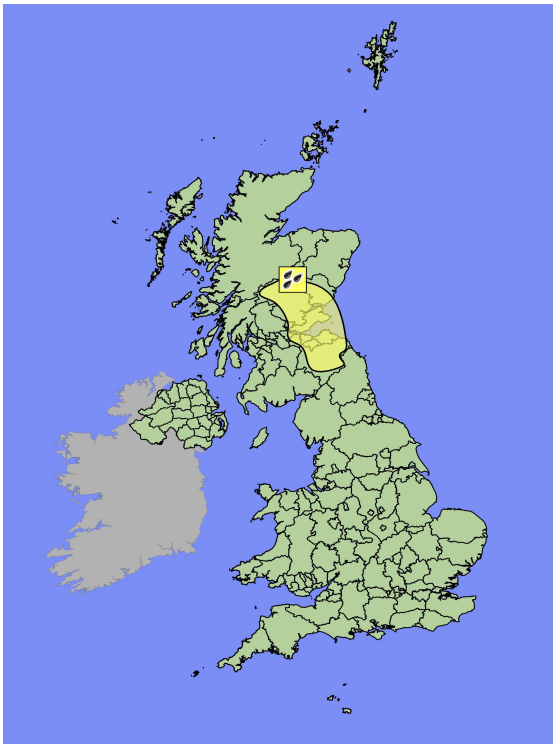
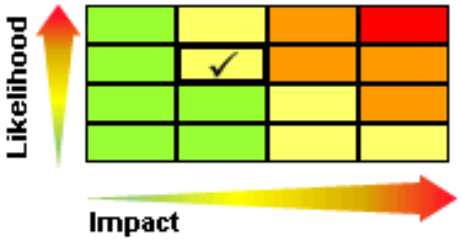
National Severe Weather Warning Service





Chief Forecasters Assessment
There is some uncertainty in developments through tomorrow, with possible updates to the areas at risk and amounts of rainfall expected. However, at present, there is the likelihood that a cold frontal zone will be re-activated and become quite slow-moving later on Tuesday and into the early part of Wednesday, leading to some prolonged and occasionally fairly heavy rainfall. Overall totals are probably most likely to be in the range of 20 to 30 mm, but may exceed 40 mm locally, with some surface water issues as a result of the continued saturated conditions.

The Met Office have issued a **Yellow Alert** of **Rain**

Valid from **16:00 on Tue, 10th Jul 2012** until **08:00 on Wed, 11th Jul 2012**

Rain will become prolonged and occasionally heavy later on Tuesday and overnight into Wednesday.

The public should be aware that the persistence of the rain, falling on already saturated ground may produce some localised flooding in prone spots by early Wednesday. The areas that catch the highest rainfall are liable to alter and this warning may be updated.
